Research Proposal

Blockchain is one of the emerging technologies in today's world and our Data scientists have long struggled to maintain the quality of a dataset for machine learning by an AI entity. Datasets are expensive to purchase and also maintaining the integrity of a dataset is difficult.

Blockchain as a highly secure storage medium presents a solution in maintaining the data integrity. And by using the Blockchain's immutability constructs we can create a high quality, permanent and growing datasets for deep learning. So I propose a better mechanism in providing dataset with the blockchain technology.
