

Feminist Cyber Security in smart home

The project will investigate the contemporary home as a key site for everyday engagement with technologies associated with the 'smart home', including IoT and networked devices controlling, for example, lighting, heating, energy, domestic appliances, access control, and audio-visual. The project will focus on the booming 'smart home' industry and lived (in)security experiences of its capturing and remaking of domestic life in various guises. It could be grounded in feminist human-computer interactions (HCI), security scholarship, feminist geography, and/or feminist geopolitics, and will draw on notions of intimacy, identity, and the everyday

Keywords: HCI, Feminist
